# Acetyl-Histone H3-K9 Rabbit pAb

Catalog No.: A17560 1 Publications

# **Basic Information**

Observed MW Refer to figures

Calculated MW 15kDa

**Category** Polyclonal Antibody

Applications ELISA

**Cross-Reactivity** Human, Mouse, Rat

# Background

Histones are basic nuclear proteins that are responsible for the nucleosome structure of the chromosomal fiber in eukaryotes. This structure consists of approximately 146 bp of DNA wrapped around a nucleosome, an octamer composed of pairs of each of the four core histones (H2A, H2B, H3, and H4). The chromatin fiber is further compacted through the interaction of a linker histone, H1, with the DNA between the nucleosomes to form higher order chromatin structures. This gene is intronless and encodes a replication-dependent histone that is a member of the histone H3 family. Transcripts from this gene lack polyA tails; instead, they contain a palindromic termination element. This gene is found in the large histone gene cluster on chromosome 6p22-p21.3.
