AP0227

Leader in Biomolecular Solutions for Life Science

Phospho-S6 Ribosomal Protein (RPS6)-S235 Rabbit pAb

Catalog No.: AP0227

Basic Information

Observed MW 29kDa

Calculated MW 29kDa

Category Polyclonal Antibody

Applications WB,ELISA

Cross-Reactivity Human,Mouse,Rat

Background

Ribosomes, the organelles that catalyze protein synthesis, consist of a small 40S subunit and a large 60S subunit. Together these subunits are composed of 4 RNA species and approximately 80 structurally distinct proteins. This gene encodes a cytoplasmic ribosomal protein that is a component of the 40S subunit. The protein belongs to the S6E family of ribosomal proteins. It is the major substrate of protein kinases in the ribosome, with subsets of five C-terminal serine residues phosphorylated by different protein kinases. Phosphorylation is induced by a wide range of stimuli, including growth factors, tumorpromoting agents, and mitogens. Dephosphorylation occurs at growth arrest. The protein may contribute to the control of cell growth and proliferation through the selective translation of particular classes of mRNA. As is typical for genes encoding ribosomal proteins, there are multiple processed pseudogenes of this gene dispersed through the genome.

Validation Data

Western blot analysis of lysates from NIH/3T3 cells using Phospho-S6 Ribosomal Protein (RPS6)-S235
,औAabbit pAb (AP0227) at 1:800 dilution. NIH/3T3 cells were treated by 20% FBS at 37℃ for 90 minutes
180kDa – after serum starvation overnight.
Secondary antibody:HRP Goat Anti-Rabbit IgG (H+L)(AS014) at 1:10000 dilution.
^{70kDa} Lysates/proteins: 25 μg per lane.
60kDa— Blocking buffer: 3% nonfat dry milk in TBST.
42kDa_ Detection:ECL Basic Kit (RM00020).
Exposuretime: 30s.
