# HotStart Taq 2X PCR Master Mix

Catalog: RK20603

**Size:** 100 RXN / 500 RXN

**Concentration:** 2X

**Components:** 

HotStart Taq 2X PCR Master Mix

RM20351

# **Product Description**

HotStart *Taq* DNA polymerase is an innovative antibody-modified thermostable enzyme. The activity of the enzyme is inhibited at room temperature, avoiding non-specific amplification and primer dimer formation during preparation of the sample and the low initial first cycle temperature during PCR cycling, increasing the specificity of DNA amplification.

HotStart *Taq* 2X PCR Master Mix is an optimized ready-to-use solution containing HotStart *Taq* DNA Polymerase, dNTPs, MgCl<sub>2</sub>, KCI and stabilizers. It is ideally suited to routine PCR applications from templates such as pure DNA solutions, bacterial colonies, and cDNA products. It can amplify up to 4 kb from complex genomic DNA or up to 5 kb from lambda DNA. Applicable to PCR, colony PCR and primer extension.

**Heat Inactivation:** No

5' - 3' Exonuclease: Yes 3' - 5' Exonuclease: No

**Strand Displacement:** +

**Resulting Ends:** Single-base 3 'Overhangs

Error Rate: ~ 285x10<sup>-6</sup> bases

# 1X Master Mix Composition:

10 mM Tris-HCl, 1.5 mM MgCl<sub>2</sub>, 50 mM KCl, 0.08% IPGAL 630, 0.05% Tween 20, pH8.6@25 °C; 200  $\mu$ M dNTPs, 5% Glycerol, 25 U/ml HotStart *Taq* DNA Polymerase.

# **Instructions**

#### **Reaction setup:**

We recommend assembling all reaction components on ice and quickly transferring the reactions to a thermocycler preheated to the denaturation temperature (95  $^{\circ}$ C).

Take 25 μl /50 μl system as an example.

Composition	25 µl	50 µl	Final Conc.
Nuclease-free water	to 25 µl	to 50 µl	
10 μM Forward	0.5 μl	1 μΙ	0.2 μΜ
Primer			$(0.05{\sim}1~\mu M)$
10 μM Reverse Primer	0.5 μl	1 μΙ	0.2 μΜ
			$(0.05{\sim}1~\mu M)$
Template DNA	variable	variable	<1 μg/50 μl
HotStart Taq 2X PCR	12.5 μl	25 μl	1X
Master Mix			

## Incubated in a thermocycler as the below program:

	•	1 0	
Temperature	Time	Cycles	
95 ℃	5 min	1	
95 ℃	15-30 s		
45-68 ℃	15-60 s	30	
68 ℃	1 kb/min		
68 °C	5 min	1	
4-10 ℃	$\infty$	1	

# **General Guidelines:**

# 1. **Template:**

Use of high quality, purified DNA templates greatly enhances the success of PCR. Recommended amounts of DNA template for a  $50 \, \mu$ l reaction are as follows:

DNA	Amount
Genomic	1 ng-1 μg
Plasmid or viral	1 pg-1 ng

]

#### 2. **Primers:**

Oligonucleotide primers are generally 20–40 nucleotides in length and ideally have a GC content of 40–60%. Computer programs such as Primer3 (http://frodo.wi.mit.edu/primer3) can be used to design or analyze primers. The final concentration of each primer in a reaction may be 0.05–1  $\mu$ M, typically 0.1–0.5  $\mu$ M.

# 3. Mg++ and additives:

Mg++ concentration of 1.5–2.0 mM is optimal for most PCR products generated with *Taq* DNA Polymerase. The final Mg++ concentration in 1X HotStart *Taq* PCR Master Mix is 1.5 mM. This supports satisfactory amplification of most amplicons. However, Mg++ can be further optimized in 0.5 or 1.0 mM increments using MgCl<sub>2</sub>.

Amplification of some difficult targets, like GC-rich sequences, may be improved with additives, such as DMSO or formamide.

#### 4. **Denaturation:**

An initial denaturation of 30 seconds at 95  $^{\circ}$ C is sufficient for most amplicons from pure DNA templates. For difficult templates such as GC-rich sequences, a longer denaturation of 2-4 minutes at 95  $^{\circ}$ C is recommended prior to PCR cycling to fully denature the template. With colony PCR, an initial 5 minutes denaturation at 95  $^{\circ}$ C is recommended.

During thermocycling a 15–30 second denaturation at 95  $^{\circ}$ C is recommended.

# 5. Annealing:

The annealing step is typically 15–60 seconds. Annealing temperature is based on the Tm of the primer pair and is typically 45–68 °C. Annealing temperatures can be optimized by doing a temperature gradient PCR starting 5 °C below the calculated  $T_m$ . When primers with annealing temperatures above 65 °C are used, a 2-step PCR protocol is possible.

#### 6. Extension:

The recommended extension temperature is 68  $^{\circ}$ C. Extension times are generally 1 minute per kb. A final extension of 5 minutes at 68  $^{\circ}$ C is recommended.

## 7. Cycle number:

Generally, 25–35 cycles yields sufficient product. Up to 45 cycles may be required to detect low-copy-number targets.

#### 8. 2-step PCR:

When primers with annealing temperatures above 65  $^{\circ}$ C are used, a 2-step thermocycling protocol is possible.

Thermocycling conditions for a routine 2-step PCR:

Temperature	Time	Cycles
95 ℃	5 min	1
95 ℃ 65-68 ℃	15-30s 1kb/min	30
65-68 ℃ 4-10 ℃	5min ∞	1

### 9. PCR product:

The PCR products generated using HotStart *Taq* DNA Polymerase contain dA overhangs at the 3 ´-end; therefore the PCR products can be ligated to dT/dU-overhang vectors.
